## **DISCLAIMER AND LIMITED WARRANTY**

This software product and the attached instructional materials are sold "AS IS" without warranty as to their performance. The entire risk as to the quality and performance of the computer software program is assumed by the user. The user, and not the manufacturer, distributor or retailer assumes the entire cost of all necessary service or repair to the computer software program. DON'T ASK Inc. shall have no liability or responsibility to the purchaser or any other person or entity with respect to any liability, loss or damage caused or alleged to be caused directly or indirectly by this product, including but not limited to any interruption in service, loss of service, loss of business and anticipatory profits or consequential damages resulting from the use or operation of the software, hardware, or documentation portions of this product.

However, to the original purchaser only, DON'T ASK Inc. warrants that the medium on which the program is recorded will be free from defects in materials and faulty workmanship under normal use and service for a period of ninety (90) days from the date of purchase. If a defect in the medium should occur during this period, the medium should be returned for repair or replacement to DON'T ASK or to its authorized dealer. After this ninety day period, media inoperable for any reason may be returned to DON'T ASK only along with \$5.00 for prompt replacement. Hardware devices supplied with this product are warranted on a similar basis except that after the 90 day period, replacement cost shall be \$15.00.

The above warranties for goods are in lieu of all other express warranties and no implied warranties of merchantability and fitness for a particular purpose or any other warranty obligation on the part of DON'T ASK shall last longer than ninety (90) days. Some states do not allow limitations on how long an implied warranty lasts, so the above limitation may not apply to you. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

## **NOTICE:**

Upon receipt of this computer program and associated documentation, DON'T ASK grants to you a non-exclusive license to execute the enclosed software and to make back-up copies of some of these computer programs for your personal use only, and only on the condition that all copies are conspicuously marked with the same copyright notices that appear on the original. This software and accompanying instructional materials are copyrighted. You are prohibited from reproducing, translating, or distributing the software or instructional materials in any unauthorized manner.

No portion of the software contained within this product may be incorporated within or included with another computer program that is to be sold, reproduced, or transferred to other parties in any way without the express written permission of DON'T ASK, Inc. A run-time package of the speech synthesis program is available to be licensed directly from DON'T ASK. For further information contact:

### NOTICE:

DON'T ASK does not guarantee the compatibility of the S.A.M. programs with any other software packages, languages, operating systems, or hardware devices other than those specifically discussed in this manual.

Information on compatibility with specific products may from time-to-time become available upon request from DON'T ASK.

## INTRODUCTION

### **Congratulations!**

You have just purchased S.A.M. — the Software Automatic Mouth — a versatile, high-quality speech synthesizer created entirely in software. You have added quality speech to your personal computer for a lower cost than ever before possible and, in the bargain, have gained features that other speech synthesizers cannot offer.

S.A.M. is designed to be easy to use. With a couple of simple program statements, you can add speech to your BASIC or assembly-language programs. When you have mastered the easy-to-learn phonetic alphabet, the inflection system, and the use of pitch and speed controls, you will be amazed at what you can make S.A.M. do. **And**, until then it will already match the performance of other speech synthesizers.

We strongly suggest that you read this manual carefully while learning to use S.A.M. There are thorough discussions of S.A.M.'s features with illustrative examples of how to implement them. There is also a dictionary of useful words and their phonetic equivalents to help you learn the phonetic spelling system.

Also remember that as a registered S.A.M. owner, you are entitled to our services in answering your S.A.M.-related questions, providing updates and improvements to the S.A.M. program at nominal cost, and helping you with your applications of S.A.M. Yes, this is a not-too-subtle hint that you should send in your S.A.M. owner registration card today. We look forward to hearing from you.

## THE S.A.M. DISKETTE

The S.A.M. diskette contains several programs.

**1. The S.A.M. speech synthesis program —**

This program will boot in automatically and will leave your computer ready to accept speech input through BASIC or machine language programs. The program occupies about 9K bytes.

**2. RECITER —**

RECITER is the English text-to-speech program that interfaces the S.A.M. program with ordinary English text input. It is **not** used for phonetic input and must be loaded in separately (see instructions). It occupies about 6K bytes.

**3. SAYIT —**

A short BASIC program that allows you to type in strings of phonemes or text and hear them spoken immediately.

**4. DEMO —**

A BASIC program that demonstrates some of S.A.M.'s features by telling a short story.

**5. SPEECHES —**

Another BASIC program that features some familiar texts to be spoken aloud by S.A.M.

**6. GUESSNUM —**

A vocal version of the old guess-the-number-between-one-and-one-hundred game. Great for kids.

We suggest that you do not write additional data on the S.A.M. diskette. Remove it after loading the desired programs.

## USING THE S.A.M. PROGRAMS

The S.A.M. program itself is a self-contained machine-language program that automatically boots in from the S.A.M. diskette when a system cartridge (e.g. BASIC or ASSEMBLER) is in the left slot. Programs using S.A.M. in the phonetic mode can be run immediately at this point.

In order to allow maximum working space in Atari memory, S.A.M. has been installed in a location that conflicts with some functions of the Atari DOS 2.0S operating system. In particular, when the DOS menu must be accessed, such as to load the RECITER program or the RS232 handler, special care must be taken. We therefore ask you to take the following steps:

1. Format a blank diskette using DOS 2.0S (S.A.M. is **incompatible** with other versions of DOS) and write the DOS files to the disk. **Do not** write DOS files to a disk **after** S.A.M. has been loaded in. These files will **not** function.
2. Copy the programs from the S.A.M. diskette onto this new disk (Use a "Q" followed by a "\*" command in DOS to copy all the files; "J" — duplicate disk will not work). The S.A.M. program itself will **not** be transferred to the new disk.
3. Create a MEM.SAV file on the new disk via the "N" command in DOS and leave this disk **un-write-protected**.
4. You can now boot your S.A.M. disk. Remove it and load the new disk you have created. You are free to use DOS now to load machine language files such as RECITER via the "L" command. Just remember that in order to use DOS with S.A.M. in the system and then return to the system cartridge, there **must** be a MEM.SAV on the disk you are using. (See the DOS 2.0S manual for further information on the use of MEM.SAV.)

We have included a S.A.M.-and-RECITER-compatible version of the RS232C handler on the S.A.M. diskette. Binary load it from DOS exactly as you do with RECITER if you need to use the RS232 interface along with S.A.M.

## RUNNING THE DEMO PROGRAMS

Once S.A.M. is binary-loaded into the computer, you are ready to run any of the BASIC demo programs such as SAYIT, DEMO, SPEECHES, AND GUESSNUM.

## USING S.A.M. FROM ATARI BASIC

S.A.M. patches into Atari BASIC by the use of the reserved string variable named SAM\$ (easy to remember).

Two BASIC statements are all that are required to make S.A.M. speak. The following statements inserted anywhere in an Atari BASIC program will cause S.A.M. to speak the phrase "I am a computer".

```
100 SAM$ = "AY4 AEM AH KUMPYUW3TER."  
110 A =USR (8192)
```

By using Atari BASIC'S string handling capabilities, it is possible to generate the SAM\$ string from sentence fragments, data statements, text files, etc. Just make sure the SAM\$ string is DIMensioned in your program (it can be DIMensioned no more than 255 characters long). The GUESSNUM program listed in this manual illustrates some of the techniques of using S.A.M. in BASIC.

### SOME ADDITIONAL NOTES:

1. To avoid stepping on S.A.M. with your Atari BASIC program, do not make any changes in the value of LOWMEM.
2. S.A.M. makes use of the "zero" sound register in the Atari (location \$D201). You may use the other three sound registers undisturbed during vocal output. S.A.M. has no effect on Atari graphics modes other than using up memory that might be needed for large programs requiring high resolution (e.g. GR.8) graphic display.
3. S.A.M. disables interrupt requests and shuts down the ANTIC chip during vocal output. Therefore, the screen will blank out and the BREAK key will not operate while S.A.M. is speaking. See the Technical Notes for more details.

## USING RECITER FROM ATARI BASIC

To use RECITER from Atari BASIC, follow this procedure:

1. Boot S.A.M. in from the S.A.M. diskette.
2. Enter DOS from a disk containing MEM.SAV (see page 6 ) and RECITER.
3. Type "L" for Binary Load
4. Type "RECITER"
5. You are ready to use RECITER.

Using RECITER from Atari BASIC is the same as using S.A.M. in his phonetic mode. However, this time the string SAM\$ is in plain English. Also the calling address is different.

```
100 SAM$ = "I AM A COMPUTER."  
110 A = USR( 8199 )
```

Use of punctuation with RECITER is discussed later, but note that a dash will be treated as a pause-making dash only if there is non-letter (not A-Z) on both sides of it. Examples: the dash in "YOU ARE A RAT-FINK" will not pause, but the dash in "HELLO JIM - THIS IN ANN" will.

## USE OF S.A.M. AND RECITER FROM MACHINE LANGUAGE

This is very similar to using S.A.M. from Atari BASIC except for one change: you must do your own string handling. A string of ATASCII characters (the same ones you would use in BASIC) is moved into locations \$2014- 2113 . The first character must be in \$2014 and the last character, an \$9B return character, marks the string's end. Bytes after the \$9B are not read by S.A.M. Following the string definition, a JSR \$2004 is done and S.A.M. speaks. The use of RECITER is the same except that you do a JSR \$200B instead.

## **THE RECITER PROGRAM**

RECITER is an English text-to-speech program that converts ordinary text into phonemes that S.A.M. can understand. You simply supply output strings of 256 characters or less to the program. RECITER takes care of the rest.

The program uses about 450 rules to convert English into S.A.M.'s phonetic language. Included among these rules are some stress markers for situations where the stress choice is unambiguous. In addition, S.A.M.'s usual punctuation rules still operate with some additional symbols ("!", ":", and "...") being considered as periods. The net result is that even directly-translated English text has a fair amount of inflection.

RECITER also recognizes a number of special characters. Numbers are read aloud, and several others are pronounced as well. If a character is not understood by RECITER, it simply isn't passed to S.A.M.

We recommend use of RECITER (or any text-to-speech program, for that matter) only for applications where the user has no control of the text. For example, text already in a file, text received over a MODEM, and text supplied by users unfamiliar with the phonetic system. Where the highest quality speech with full inflection is desired, we urge you to use S.A.M.'s phonetic system.

Don't be discouraged, though. You will find that RECITER will do a better job of speaking from English text than other text-translator products.

## **THE SAYIT PROGRAM**

SAYIT is a short BASIC program that allows you to test many of S.A.M. and RECITER's features by directly inputting the string SAM\$.

If both S.A.M. and RECITER have been loaded in, you may opt for English input when running the program.

Typing "ctrl-N" will allow you to input new pitch and speed values to test these features. Once you have done so, the new pitch and speed will remain until you type "ctrl-N" again.

## **PHONETIC INPUT TO S.A.M.**

### **I. THE PHONETIC SPELLING SYSTEM**

S.A.M. is equipped with a version of the easy-to-learn, very readable International Phonetic Alphabet. There are about fifty phonemes which will let you spell all the words in English. Some sounds from foreign languages are not available in the system at this time.

Why use the phonetic system? There are two compelling reasons. 1.) In the phonetic system, all the words will be pronounced correctly; and 2.) You can put inflection into the speech however and wherever you want it.

If you have already tried the RECITER text-to-speech program, you know that it does a fair job of pronouncing English words. However, it does make mistakes. Some words sound a little strange and others are difficult to understand. The reasons for this are not hard to understand. English is a language of exceptions rather than rules; words that are spelled alike are pronounced differently ("have" vs. "gave"). A rule system like RECITER cannot pronounce all words correctly unless it stores an enormous dictionary that takes up vast amounts of memory. But the second flaw in text-to-speech conversion is more serious. Such a rule system cannot decide where the stress belongs in what is being said. The phonetic system in S.A.M., on the other hand, allows you to decide where to accent syllables within a word and where to stress words within a sentence.

So it is clear that the preferred way to make S.A.M. speak is with the phonetic alphabet. But how hard is it to use? It's really easier than writing in English because **you don't have to know how to spell!** You only have to know how to say the word in order to spell it phonetically.

Here is the complete list of phonemes, each presented with a sample word containing its sound. Note that there are many vowels, which is why they are all indicated by two letters rather than one.

The phonemes are classified into two categories: vowels and consonants. Among the vowels are the simple vowel sounds such as the "i" in "sit", the "o" in "slot", and the "a" in "hat". These vowels do not change their quality throughout their duration. There are also vowels called diphthongs such as the "i" in "site", the "o" in "slow", and the "a" in "hate", as well as the "oi" in "oil" and the "ow" in "how". These vowels start with one sound and end with another (e.g. "oi" glides from an "oh" sound to an "ee" sound).

The consonants are also divided into two groups: voiced and unvoiced. The voiced consonants require you to use your vocal chords to produce the sound. Such sounds as "b", "l", "n", and "z" sounds fall into this category. The unvoiced consonants, on the other hand, are produced entirely by rushing air and include such sounds as the "p", "t", "h", and "sh" sounds.

# PHONETIC ALPHABET FOR S.A.M.

The example words have the **sound** of the phoneme, not necessarily the same letters.

## VOWELS

<b>IY</b>	feet
<b>IH</b>	pin
<b>EH</b>	beg
<b>AE</b>	Sam
<b>AA</b>	pot
<b>AH</b>	budget
<b>AO</b>	talk
<b>OH</b>	cone
<b>UH</b>	book
<b>UX</b>	loot
<b>ER</b>	bird
<b>AX</b>	gallon
<b>IX</b>	digit

## DIPHTHONGS

<b>EY</b>	made
<b>AY</b>	high
<b>OY</b>	boy
<b>AW</b>	how
<b>OW</b>	slow
<b>UW</b>	crew

## VOICED CONSONANTS

<b>R</b>	red
<b>L</b>	allow
<b>W</b>	away
<b>WH</b>	whale
<b>Y</b>	you
<b>M</b>	Sam
<b>N</b>	man
<b>NX</b>	song
<b>B</b>	bad
<b>D</b>	dog
<b>G</b>	again
<b>J</b>	judge
<b>Z</b>	zoo
<b>ZH</b>	pleasure
<b>V</b>	seven
<b>DH</b>	then

## UNVOICED CONSONANTS

<b>S</b>	Sam
<b>SH</b>	fish
<b>F</b>	fish
<b>TH</b>	thin
<b>P</b>	poke
<b>T</b>	talk
<b>K</b>	cake
<b>CH</b>	speech
<b>/H</b>	ahead

The following symbols are used internally by some of S.A.M.'s rules, but they are also available to the user.

<b>YX</b>	diphthong ending
<b>WX</b>	diphthong ending
<b>RX</b>	R after a vowel
<b>LX</b>	L after a vowel
<b>/X</b>	H before a non-front vowel or consonant
<b>DX</b>	"flap" as in pity

## SPECIAL PHONEMES

<b>UL</b>	settle (= AXL)
<b>UM</b>	astronomy (= AXM)
<b>UN</b>	function (= AXN)
<b>Q</b>	kitten (glottal stop)

Note: The symbol for the "H" sound is **/H**. A glottal stop is a forced stoppage of sound.

On the phoneme chart, you will notice six phonemes — YX, WX, RX, LX, /X, and DX — which are described as being used by S.A.M.'s rule system. However, they have been provided with letter codes so that you may experiment with these special sounds directly. YX and WX are weaker versions of Y and W. RX and LX are smooth gliding versions of R and L. /X is the "h" sound in "who", and DX is the quick flap of the tongue on the upper palate as in the word "pity".

We are now ready to transcribe ordinary speech into its phonetic representation. Let's use the following sentence as an example:

### **I do my calculations on the computer.**

The first step is to say each word aloud and decide how many syllables are in the word: a syllable has **one** vowel phoneme and its associated consonants (if any). We then identify the proper vowel phoneme by comparing its sound to the sounds listed in the table, and do the same for the consonants. The resultant combination of phonemes is the phonetic representation of the syllable. We do this for each syllable in a word.

In our example, the first word — "I" — is a single phoneme, the diphthong "AY". The next word — "do" — is a single syllable comprised of the diphthong "UW" preceded by the voiced consonant "D". The phonetic spelling is therefore "DUW". Similarly, the third word — "my" — again uses the "AY" sound, this time preceded by an "M", resulting in "MAY".

The word "calculations" has four syllables. The first syllable transcribes as "KAEL". The "c" sound is pronounced as "k", unlike the "s" pronunciation in a word like "cell" (notice there is no "C" in the phoneme table). The next syllable — "cu" — transcribes as "KYUW". Note here that the "Y" sound prevents this syllable from being pronounced as "coo". The third syllable comes out as "LEY", and the fourth becomes "SHAXNZ". This word ends with a voiced sound "Z" and not the hissy "S" sound as in "list". You will rapidly discover that many words contain the phonetic combinations "AXL", "AXM", and "AXN". To enhance the readability of the phonetic spelling, the special symbols "UL", "UM", and "UN" can be substituted for these combinations. The "tions" syllable is now written as "SHUNZ". So "calculations" becomes "KAELKYUWLEYSHUNZ".

The next word "on" becomes "AAN", and "the" becomes "DHAX". By the way, if the word "the" precedes a word beginning with a vowel, it gets pronounced "thee" and is spelled "DHIY". You should also notice that the "th" letter combination has two phonetic representations: unvoiced (TH) as in "thin", or voiced (DH) as in "the".

By now, the steps used in getting from "computer" to "KUMPYUWTER" should already be obvious. Try it.

Once you get used to the phonetic system, it will seem very easy and obvious. Initially, there will be some spellings that seem tricky (did you know that "adventure" has a "CH" in it?). However, the rule is always to write the word the way you **say** it, not the way you spell it.

To help you learn the system fast, we have provided an English-to-phonetic spelling dictionary of almost 1500 words. Many common words are in the dictionary; some unusual ones are in it as well. If you are really stuck on how to spell a word that isn't in the dictionary, think of another word that sounds like it and that one may be listed.

In any case, don't hesitate to experiment with the phonetic spelling system. Let your ears be your guide. This system is easy to learn, easy to use, easy to read, and you will be amazed at what you can do with it.

## II. ADDING STRESS TO S.A.M.'S SPEECH

In the phonetic mode, S.A.M. is capable of speaking with a great deal of inflection and emphasis. This gives a much more natural and understandable quality to the speech than is otherwise possible.

The stress system for S.A.M. is particularly easy to use. There are eight stress markers that can be used simply by inserting a number (1-8) **after** the vowel to be stressed. For example, the monotonic pronunciation of the word "hello" produced by the phonetic spelling "/HEHLOW" becomes a much friendlier sounding greeting when spelled "/HEH3LOW".

Why do you have to put in the stress markers? Simply because they can go **anywhere** and S.A.M. has no way of knowing where you **want** them to go. The following simple example will demonstrate this point to you. Use the SAYIT program on your S.A.M. disk to hear the following sample phrases.

We will have S.A.M. say

**"Why should I walk to the store?"**

in a number of different ways.

1. WAY2 SHUH7D AY WAO5K TUX DHAH STOHR.  
(You want a reason to do it.)
2. WAY7 SHUH2D AY WAO7K TUX DHAH STOHR.  
(You are reluctant to go.)
3. WAY5 SHUH7D AY2 WAO7K DHAH STOHR.  
(You want someone else to do it.)
4. WAY5 SHUHD AY7 WAO2K TUX7 DHAH STOHR.  
(You'd rather drive.)
5. WAY5 SHUHD AY WAO5K TUX DHAH STOHR2OH7R.  
(You want to walk somewhere else.)

Each of these stress examples has a slightly different meaning, even though the words are all the same. Stress markers give you the ability to let S.A.M. be expressive.

What do the stress markers do? The number you type tells S.A.M. to raise (or lower) his pitch and elongate the associated vowel sound.

The number system works like this:

- 1 = very emotional stress
- 2 = very emphatic stress
- 3 = rather strong stress
- 4 = ordinary stress
- 5 = light stress
- 6 = neutral (no pitch change) stress
- 7 = pitch-dropping stress
- 8 = extreme pitch-dropping stress

When should you use each of these? It all depends on how you want S.A.M. to sound. Say the words to yourself as expressively as you can and see where **your** voice rises and falls. Remember: the smaller the number, the more extreme the emphasis will be. Also, the stress markers will help get difficult words pronounced correctly. If some syllable is not enunciated sufficiently, put in a neutral stress marker.

A general rule is that the most important word or words in a sentence get the most stress and the rest of the words get little or no stress. However, words of more than one syllable should have stress marked on their accented syllables (most dictionaries show which these are if you are uncertain).

We will now assign stresses to our first example sentence about doing calculations on the computer. The first word "AY" is usually an important word (can you think of anyone more important?). We will write it as "AY4", assigning ordinary stress. "DUW", the only verb, is also important. We'll try "DUW4". "MAY" isn't very strong (unless you want to draw attention to it) and it is a single syllable, so we will leave it alone. "KAELKYUWLEYSHUNZ" is polysyllabic so we **must** identify the accented syllables. It is also the most important word in the sentence so it will have the strongest stress. "LEY" has the primary stress and "KAEL" receives the secondary stress, so we will write "KAE4LKYUWLEY3SHUNZ". "AAN" and "DHAX" are short, unstressed words. "KUMPYUWTER" has a single accent on "PYUW" and gets written "KUMPYUW4TER". So, our original sentence gets written

**AY4 DUW4 MAY KAE4LKYUWLEY3SHUNZ AAN DHAH KUMPYUW4TER.**

Try typing it into the SAYIT program compared to the unstressed version.

How about really unusual stress? When you place extraordinary emphasis on a word, you do so by elongating its vowel sounds. S.A.M. can do the same thing. For example, a call for help can become "/HEH5EH4EH3EH2EH2EH3EH4EH5EHLP." You can always do this with the ordinary vowel sounds, but be careful with the diphthongs. They are complex sounds and if you repeat them, they will not do what you want (e.g. "OYOYOYOYOYOY" sounds just like it reads in English). To extend the diphthong sounds, you need to break them into component parts. So "OY" can be extended with "OH OH IY IY IY", and "AY" can be extended with "AA AAIY IY IY". You should experiment to find out just what you can do.

Unlike many other speech synthesis systems, S.A.M. allows you to control consonant stresses directly. This is usually done to produce a special tonal pattern in a word. Sometimes you might want a pitch rise on the final phoneme occurring just before a comma. For example, try typing: "AY4 YUWZ SAE5M3, AE4ND RIYSAY4TER." Notice how the pitch rises on the "M". It is never necessary to specify stress for a consonant occurring immediately before a stressed vowel. This is handled automatically.

Try to become familiar with the stress marker system. It makes all the difference between an ordinary speech synthesizer and the very expressive S.A.M.

### **III. THE EFFECTS OF PUNCTUATION**

S.A.M. understands four punctuation marks. They are the hyphen, comma, period, and question mark.

The hyphen (-) serves to mark clause boundaries by inserting a short pause in the speech. It also has other uses to be discussed later. The comma marks phrase boundaries and inserts a pause approximately double that of the hyphen. The question-mark and period mark the end of sentences. The period inserts a pause and also causes the pitch to fall. The question-mark also inserts a pause, but it causes the pitch to rise. Notice that not all questions should end with a question-mark (rising pitch), only those that require a yes-or-no answer. ("Are we hiking today?" rises; "Why are we going to the woods?" falls at the end and should be marked with a period).

### **IV. FINAL NOTES ON PHONETIC INPUT**

S.A.M. is capable of speaking only 2.5 seconds of speech without a break (this is the size of his "breath"). If the string to be spoken exceeds this, S.A.M. will insert short breaks every 2.5 seconds. S.A.M. **always** breaks at punctuation marks in anticipation of the following phrase. So, if you don't like where S.A.M. broke up a phrase, you can specify your own breaks with hypens. An example of this is: "I use the telephone - to call out of town".

S.A.M. uses the spaces between words to make his sentence-breaking decisions. If a single word requires more than 2.5 seconds to say, S.A.M. will not be able to insert his own breaks and will therefore be unable to say the word.

In summary, the procedures outlined above may seem complex, but this is because they were presented in fine detail. In reality, the steps become automatic and you will soon be able to type in phonetics almost as fast as you can type English text.

## THE USE OF PITCH AND SPEED CONTROLS

S.A.M. is capable of speaking in a wide range of tones and at many different rates. Both pitch and speed controls are accessed by single POKES to memory locations. The following chart shows the effects of different values in the pitch and speed registers.\*

### PITCH

POKE PITCH, N

N=

00-20	impractical
20-30	very high
30-40	high
40-50	high normal
50-70	normal
70-80	low normal
80-90	low
90-255	very low

default = 64

### SPEED

POKE SPEED, M

M=

0-20	impractical
20-40	very fast
40-60	fast
60-70	fast conversational
70-75	normal conversational
75-90	narrative
90-100	slow
100-225	very slow

default = 72

\*see the memory reference chart for these locations

## WHAT AM I HEARING?

In recent years, many new speech synthesizers have appeared in the marketplace. The techniques they use vary widely depending on the intended application. Most synthesizers found in consumer products, such as talking televisions or microwave ovens, use a "speech compression" technique of one sort or another. These techniques require a person to speak the needed words or entire sentences. The speech waveform is then "compressed" using a mathematical algorithm and, as a result, can then be stored in a memory chip without taking up a lot of room. The synthesizer's job is to then take this compressed speech information and expand it back into the original waveform. Some of these systems work quite well, retaining the speaker's intonation and sometimes even his or her identity. The processes used in such synthesizers differ greatly from those used in unlimited vocabulary synthesizers like S.A.M.

Let's follow the evolution of an unlimited vocabulary speech synthesizer. First, we must define the task. Simply, we want to create a system that will synthesize any English utterance. One way to begin would be to record every possible utterance on tape and just play back the right one whenever we need it. This would take up more tape or computer memory than could ever exist, so this method is obviously not too practical.

The next method might be to record all the English words and play them back in a specific order to create sentences. This is certainly practical. It would take up a large amount of memory, but it would work. However, we have lost something in this process. The words now sound disjointed because we have "spliced" the sentence together. Also, the stress or inflection pattern of the sentence is either wrong or non-existent. If we wanted an accurate stress pattern, we would need to record every word in a number of different styles, at different pitches, etc.

Such a system needs too much memory. So, let's break things down even further and try to store as little as possible in memory. Instead of storing sentences or words or even syllables, we could store phonemes. Phonemes are the atoms of spoken language, the individual speech sounds. It turns out that English has a little over forty of them. Wow — this takes up practically no memory at all! We could specify the phonemes in the order we need to create words and sentences and really have ourselves a system. So, we go and record the phonemes and play them back to say the sentence, "I am a computer." Why can we barely understand it? It seems we have broken things down a bit too far. When we chop the words down to this level and then try to reassemble them, everything that blends one sound into another is lost and the results are nothing less than horrible.

But all is not lost. Our efforts are not wasted because we have the acoustic-phonetician to come to our rescue. These people deal in the study of speech sounds and they can tell us just how to repair our phoneme-based system. First, instead of recording the actual speech waveform, we only store the frequency spectrums. By doing this, we save memory and pick up other advantages. Second, we learn that we need to store some data about timing. These are numbers pertaining to the duration of each phoneme under different circumstances, and also some data on transition times so we can know how to blend a phoneme into its neighbors. Third, we devise a system of rules to deal with all this data and, much to our amazement, our computer is babbling in no time.

The advantages in synthesizing speech in this way are tremendous. We use very little memory for all the data and the rules to use that data, and we also gain the ability to specify inflection, timing, and intonation. This is because we have not stored actual speech sounds, only their spectrums. (You can think of this as a printer needing only four colors of ink to reproduce all the colors in a picture.)

Now, in actuality, we do not store all the spectrums, but only those that are targets. Each phoneme has associated with it a target spectrum which can be specified with very little data. The target may be thought of as a "frozen" speech sound, the sound you would be making if your mouth was frozen exactly in the middle of pronouncing the phoneme. The timing rules tell the synthesizer how to move from target to target in a manner that imitates the timing of a human talker.

S.A.M. is this type of synthesizer implemented entirely in software. It has the tables of phoneme spectra and timing, together with the rules for using this data to blend the sounds together into any English utterance we may have in mind. We have traded some quality from the method using all the recorded words, but what we have gained is versatility, practicality, and the ability to do it all in real time, with very little memory usage, on an inexpensive microcomputer.

## FINDING PHONEME SPELLING ERRORS

If you have made a phonetic spelling mistake that causes S.A.M. to be unable to break your string down into phonemes, he will beep twice at you and come back to BASIC without speaking. The location of the bad letter in the string is stored for you to examine. Also, you may PEEK at this location in a program to see if there were any errors in spelling and then make the required changes.

Here is a sample error-checking and display program:

```
100  SAM$ = "MAY VOY4C IHZ BIHZAA5R."
110  A =USR ( 8192 )
120  IF PEEK ( 8211 ) < 255 THEN GOSUB 1000:REM ERROR CHECK

1000 REM ERROR DISPLAY — ERROR APPEARS IN INVERSE
1010 N = PEEK ( 8211 ):REM N IS POSITION OF ERROR
1020 SAM$(N,N) = CHR$(ASC(SAM$(N,N))+128)
1030 PRINT SAM$
1040 RETURN
```

The inverse character marks the spot where S.A.M. could no longer continue reading the string.

## TECHNICAL NOTES USE IN BASIC

S.A.M. from BASIC performs all stack housekeeping that is required.

When S.A.M. completes vocal output, the NMIEN (Non-maskable Interrupt Enable) (\$D40E) returns to the following conditions:

BIT 6 — Vertical Blank Interrupt Enable = "on"

BIT 7 — Display List Instruction Interrupt Enable = "on"

All other registers are returned to OS shadow values within 1/60 second after vocal output.

Note that during speech, the VBI is shut down so that the real-time clock registers (18, 19, 20) do not advance.

## SCREEN BLANK

The screen blanks during vocal output because Direct Memory Access (DMA) causes gaps to be inserted into the speech waveform each time the 6502 processor waits for the ANTIC chip to access memory. The audible result is extremely distorted speech when the screen is on.

If this speech quality is desirable for some application (or the screen must remain on during speech), S.A.M. may be operated in the DMA-enabled mode by POKE-ing a "1" into the "lights" register: **8210**. There are different speed and pitch addresses to be used in this case. To return to DMA-disabled speech, POKE a "0" into this register.

## SELDOM-USED PHONEME COMBINATIONS

Phoneme Combination	You probably want:	Unless it splits syllables like:
GS	GZ e.g. bags	bugspray
BS	BZ e.g. slob	obscene
DS	DZ e.g. suds	Hudson
PZ	PS e.g. slap	—
TZ	TS e.g. curtsy	—
KZ	KS e.g. fix	—
NG	NXG e.g. singing	ingrate
NK	NXK e.g. bank	Sunkist

## **FUTURE IMPROVEMENTS**

Improvements upon and modifications to the S.A.M. system may occur in the future. Such new versions of S.A.M. will be made available at nominal cost to registered S.A.M. owners.

We are also planning to release a new program called "SUPERECITER". RECITER presently has a pronunciation accuracy of about 90%. SUPERECITER will show a major improvement in this area. But, we need your help.

If you hear a word mispronounced by RECITER that you feel is important, jot it down. Send us your list of these words (or proper names) so that we may incorporate them into the expanded rule set of SUPERECITER. Your contributions will be greatly appreciated.

S.A.M. is an ongoing project at DON'T ASK Computer Software. We welcome your comments and suggestions on our software speech synthesis products.
